Unifying Innovations in Forecasting Capabilities Workshop  
(UIFCW)

9/5 0000 UTC – 9/12 0000 UTC

During IRMA (2017), forecast tracks  
changed quickly  
6 Million Floridians evacuated  
due to inadequate time for  
evacuation planning

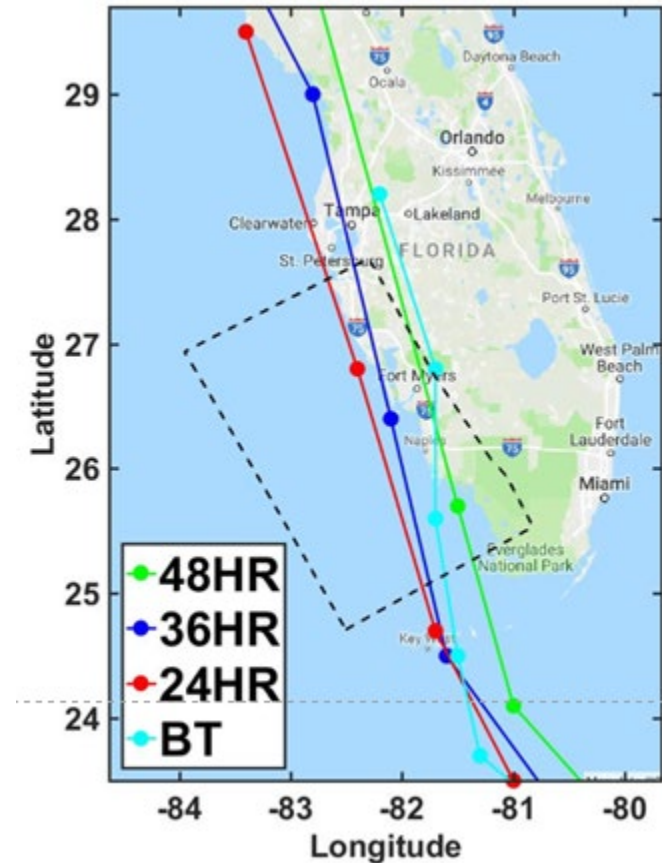

Naples

Everglades  
City

# Why is a RFMS needed?

- Hurricanes can change quickly before landfall (e.g., Irma 2017)
- High-fidelity real-time forecasting system is slow
- Surge atlas (MOMs) are static and non-probabilistic
- Some flood maps are outdated
- RFMS can enhance:
  - Real-time evacuation planning
  - Pre-season planning for many “what-if” storm scenarios
  - Quick and frequent update of flood maps

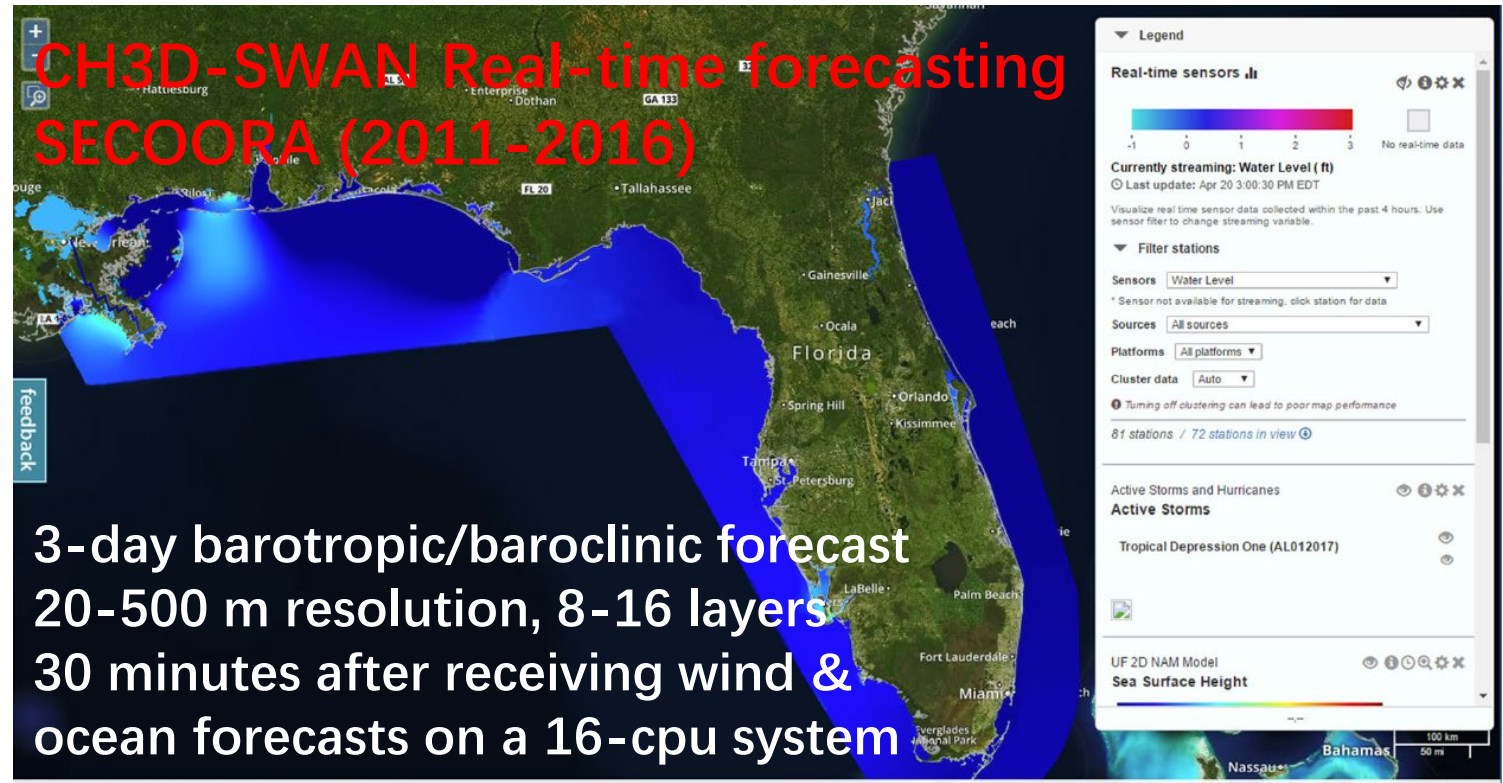

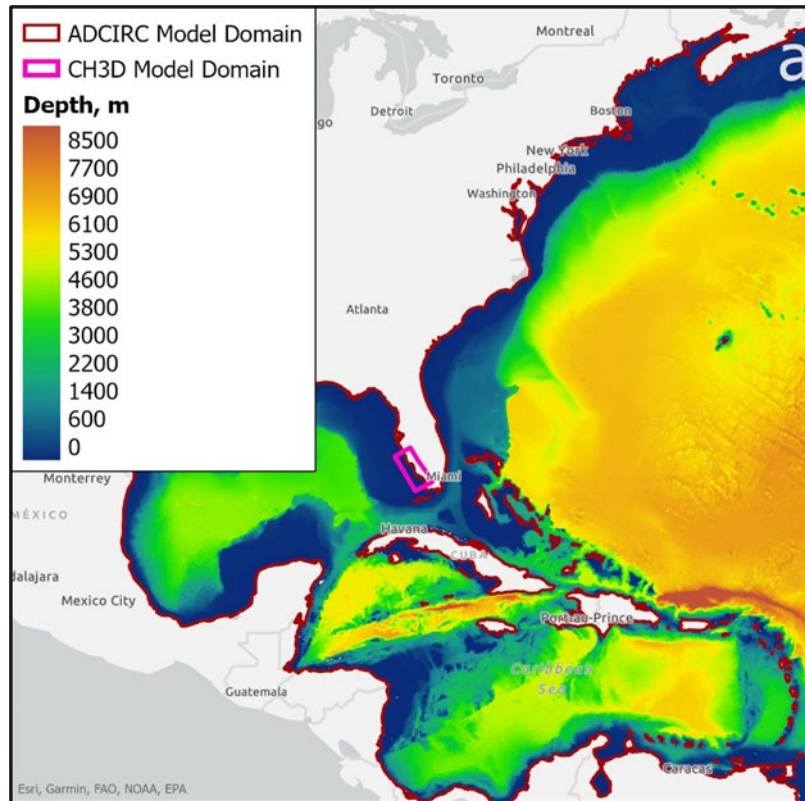

An aerial photograph showing the aftermath of a hurricane. The landscape is a mix of dark, muddy floodwater and debris. Several buildings are visible, some partially submerged or heavily damaged. The ocean is on the right side of the frame, with waves breaking against a beach. The sky is overcast with grey clouds.

**Most destroyed houses in Mexico Beach during Michael 2019 are outside FEMA Flood Zones**

**FEMA maps were based on limited storm data**

**Need to revise FLOOD MAPS quickly after a hurricane season**

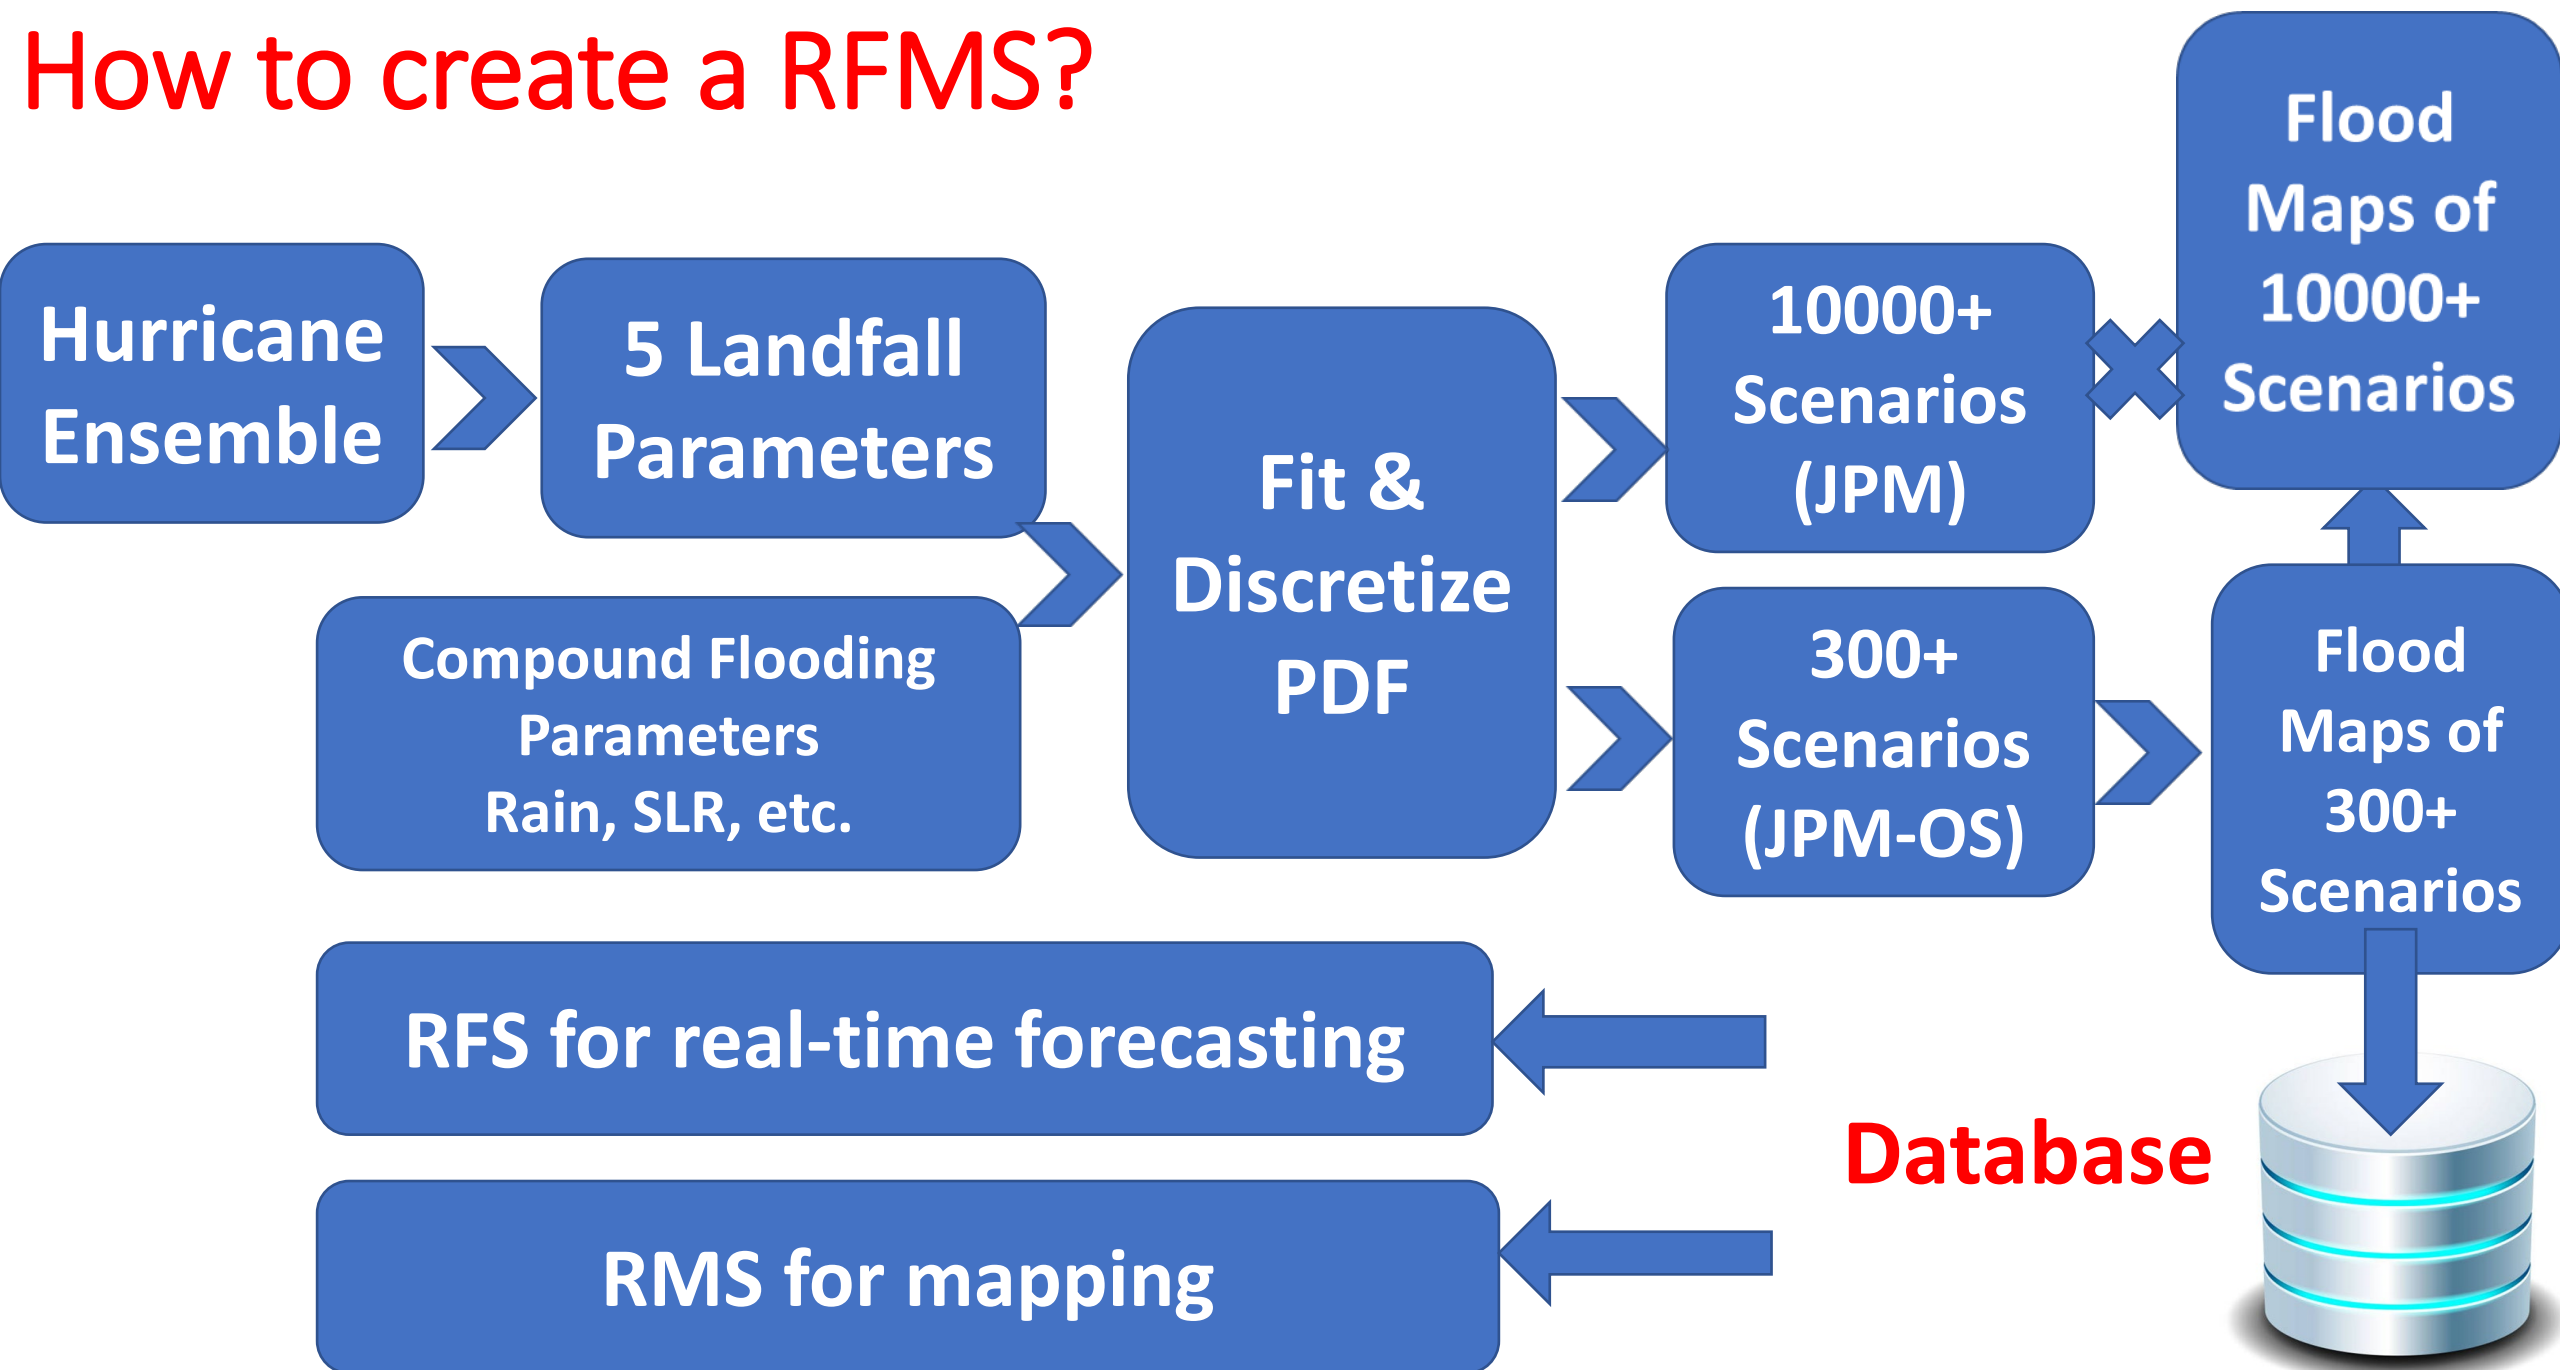

# CH3D-SWAN Vegetation-Resolving Coastal Modeling System

High-Resolution CH3D-SWAN can produce:

1. Realtime forecast of coastal inundation during a single storm
2. Maximum coastal inundation maps for 300-500 optimal storms

# How to create a RFMS?

Hurricane Irma Discussion Number 42  
NWS National Hurricane Center Miami FL AL112017  
1100 AM EDT Sat Sep 09 2017

## FORECAST POSITIONS AND MAX WINDS

INIT 09/1500Z 22.8N 79.8W 110 KT 125 MPH  
12H 10/0000Z 23.4N 80.7W 115 KT 130 MPH  
24H 10/1200Z 24.5N 81.6W 120 KT 140 MPH  
36H 11/0000Z 26.4N 82.1W 120 KT 140 MPH  
48H 11/1200Z 29.0N 82.8W 100 KT 115 MPH  
72H 12/1200Z 34.5N 86.0W 25 KT 30 MPH...POST-TROP/INLAND  
96H 13/1200Z 36.0N 89.0W 25 KT 30 MPH...POST-TROP/INLAND  
120H 14/1200Z 37.0N 88.5W 20 KT 25 MPH...POST-TROP/INLAND

## 1. Storm Advisory from NOAA/NHC

## 4. Flood Map on Web in one minute

| Pressure Deficit (mb) | Rmax (miles) | Forward Speed (mph) | Heading Direction | Landfall Location |
|-----------------------|--------------|---------------------|-------------------|-------------------|
| 89                    | 68           | 11.25               | 0                 | -40               |

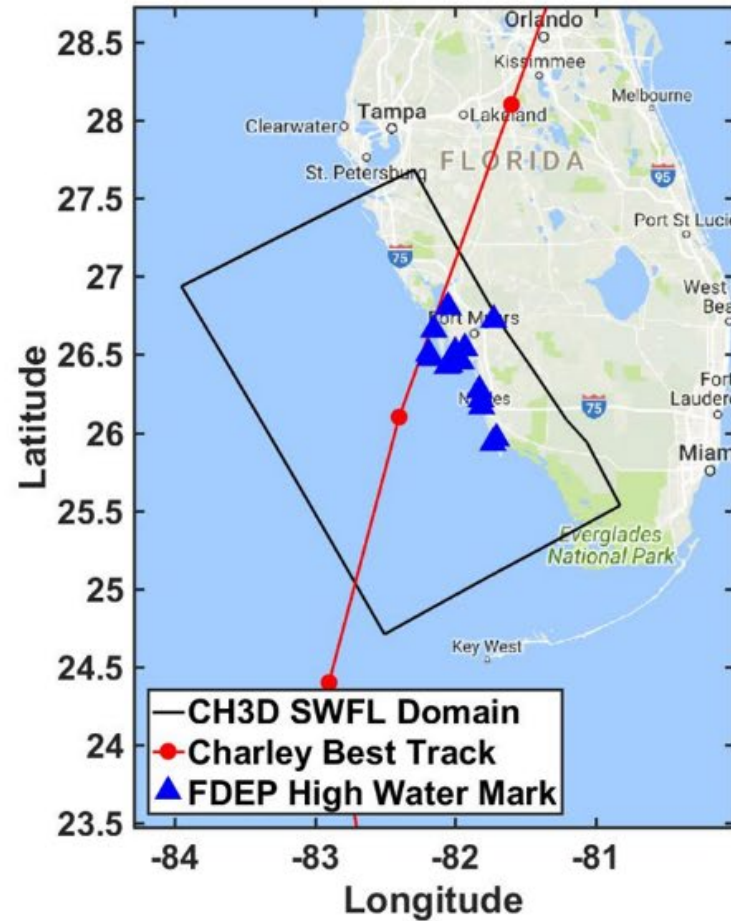

## 2. Determine Storm Parameters

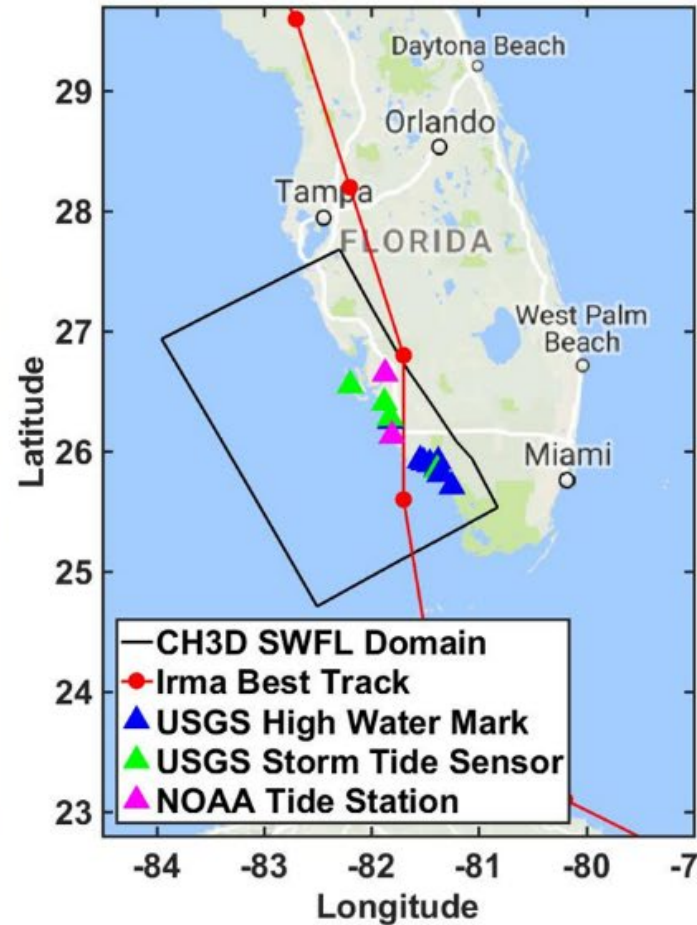

## 3. Interpolate Flood Height from Database

# Application of RFMS

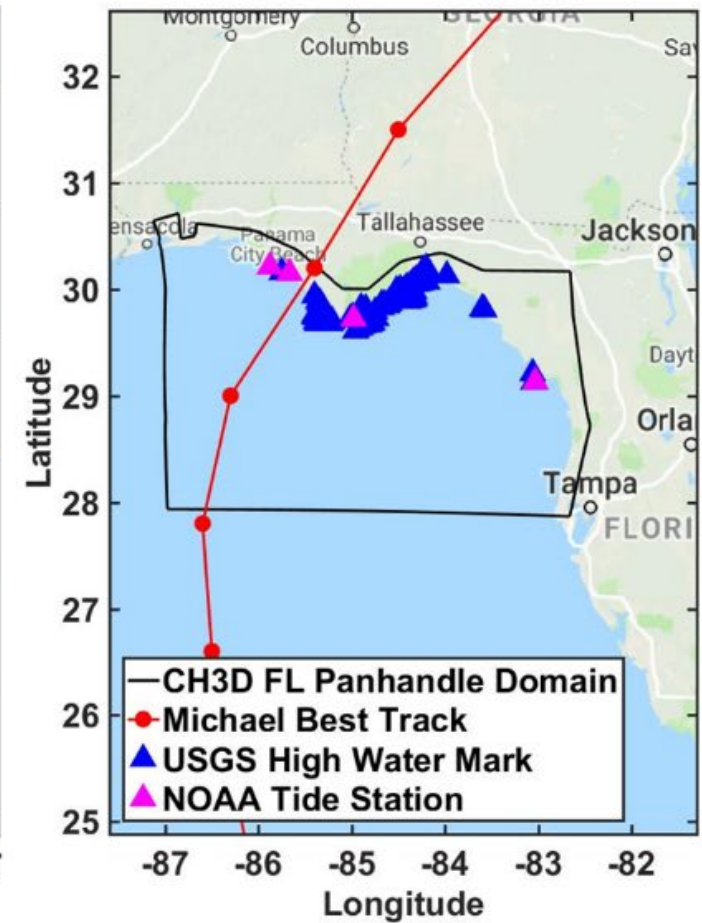

<https://link.springer.com/article/10.1007/s11069-019-03807-w>

Charley (2004)

Irma (2017)

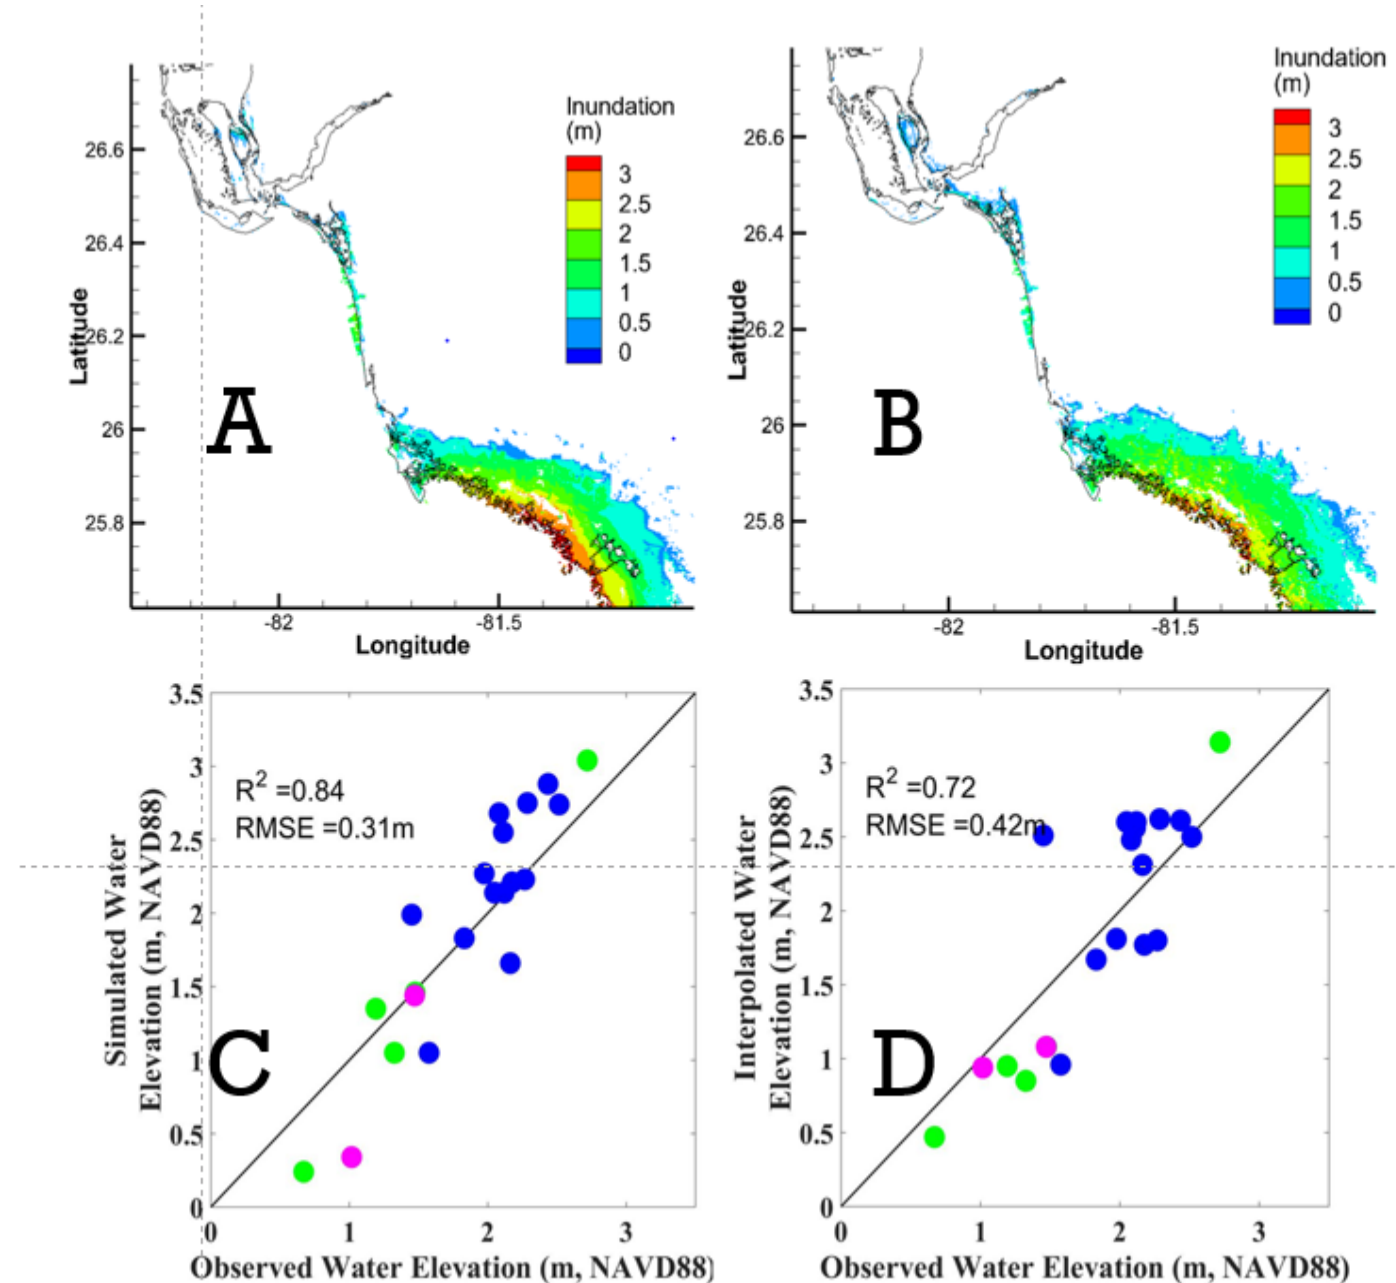

Michael (2018)

# Hurricane Irma (2017)

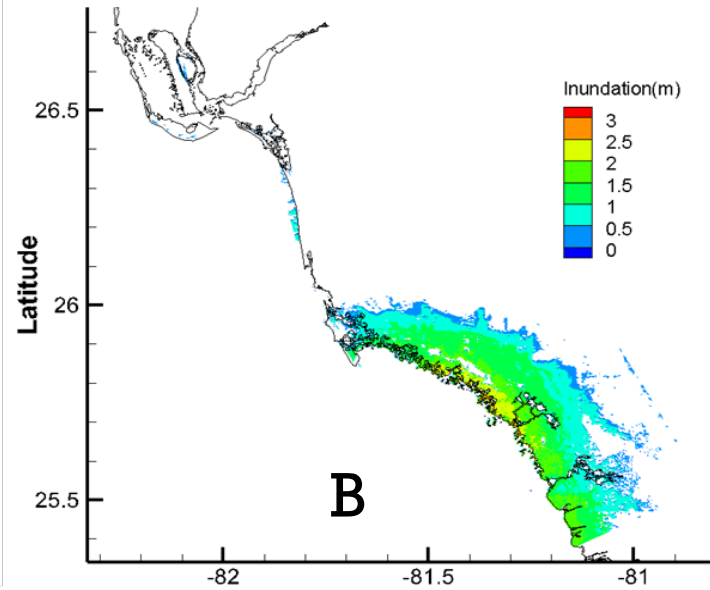

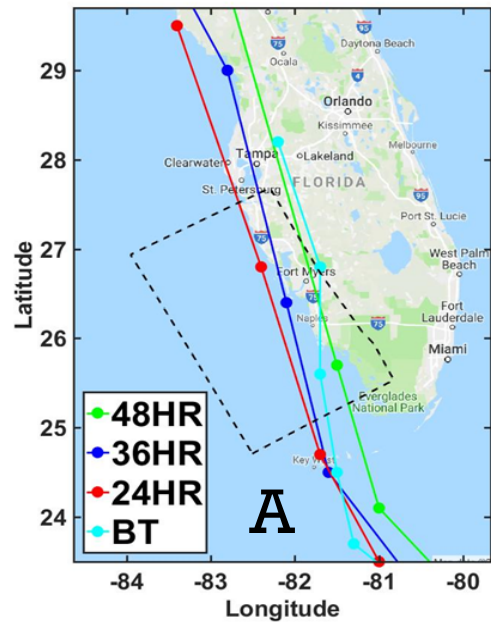

Direct simulation (Left) and  
RFMS (Right) compare well with  
data

RMSE reduced when more  
accurate wind field is used

High Water Marks are of mixed  
quality

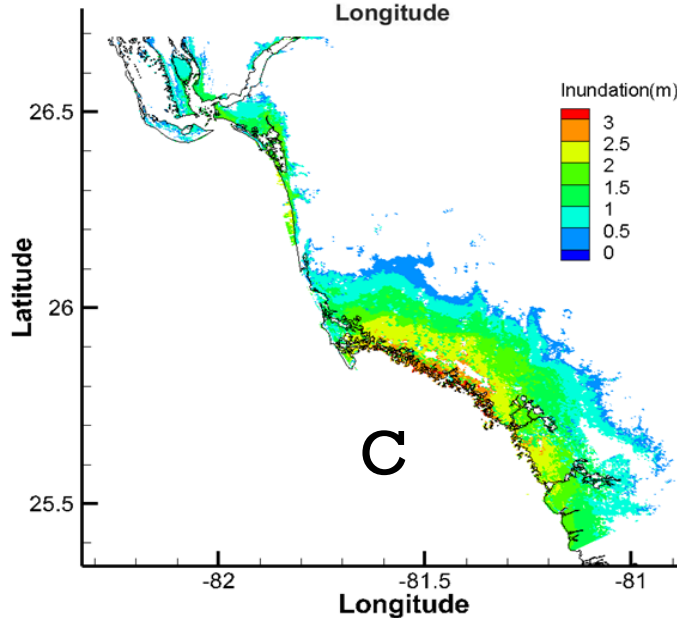

# Sudden Change in Forecast Advisory can lead to 100% change in total inundation in 24 hours!

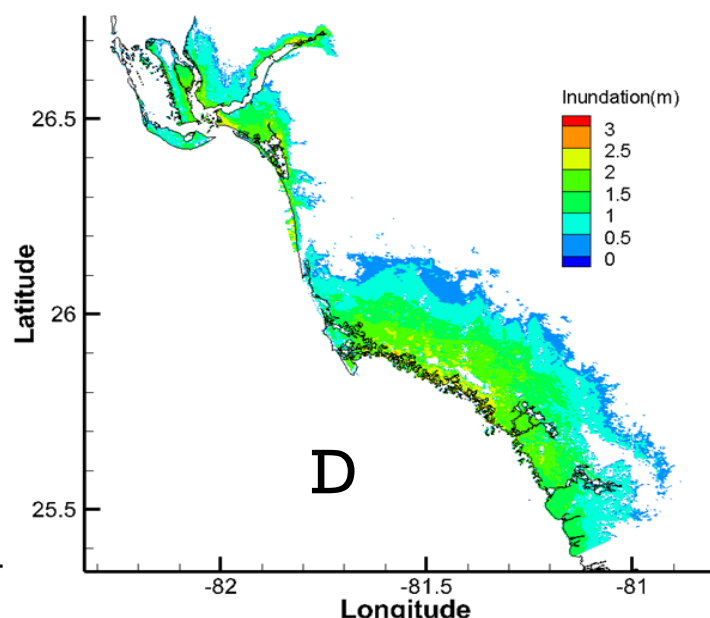

**A: IRMA forecast tracks moved westward**

**B: 48-HR advisory**

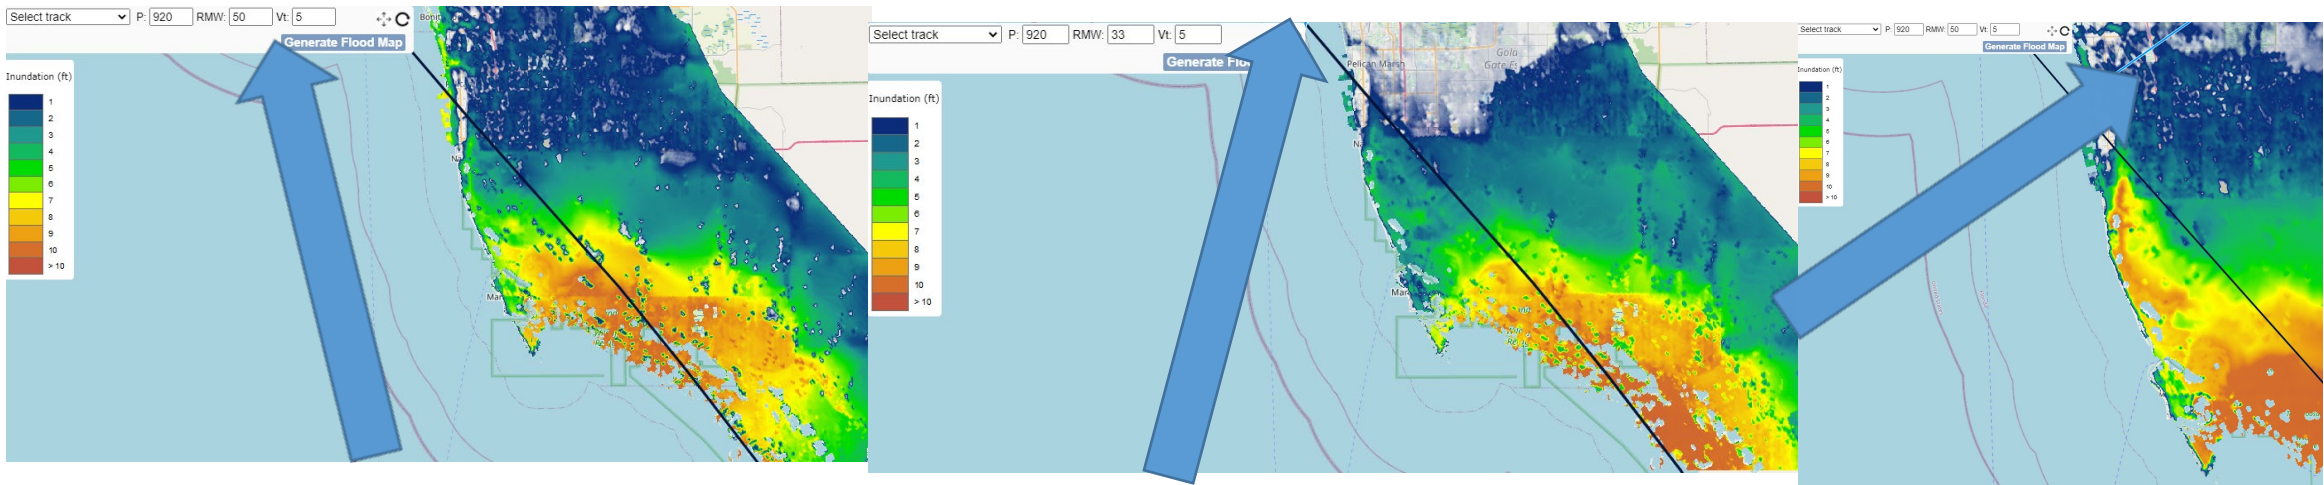

**C: 36-HR advisory**

**D: 24-HR advisory**

# RFMS Application – What-if Scenarios for Planning

Given a track, RFMS generates a maximum flood map in 3 sec on a PC (57 sec for graphics)

Aided Collier County evacuation and planning

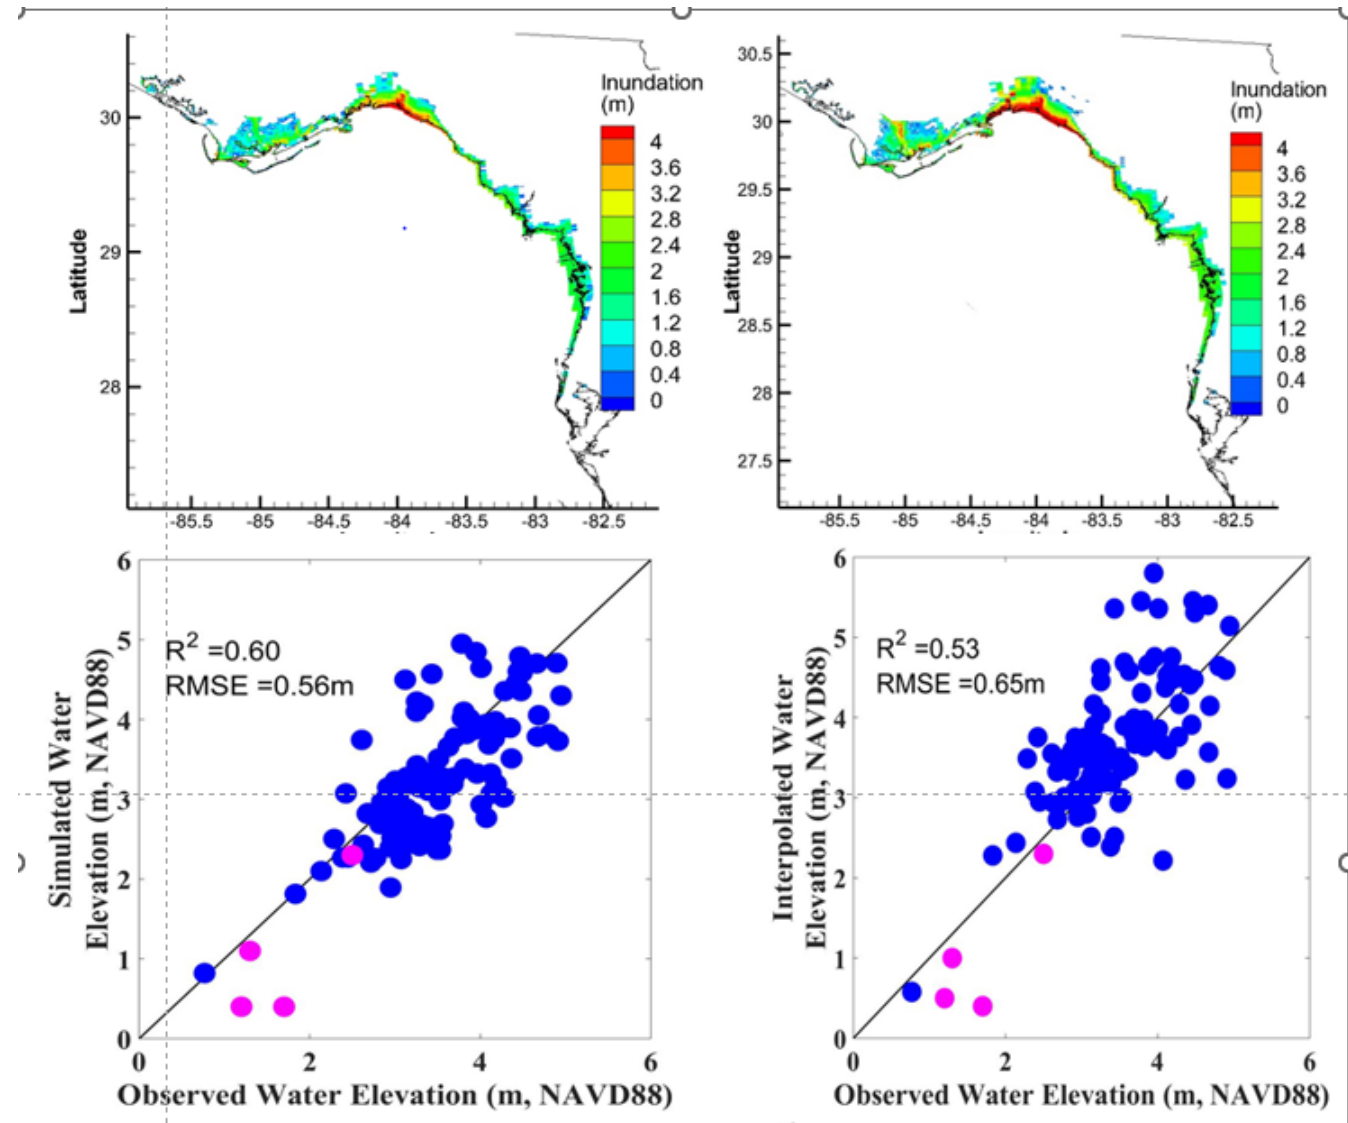

# Hurricane Michael (2018) With Rapid Intensification

Direct simulation (Left) and RFMS (Right) gave similar results which compare well with data

Finer grid size reduces the RMSE

High Water Marks of poor quality

1% flood elevation in Mexico is increased by 1 ft if Michael is included in the hurricane ensemble

# Summary

- RFMS, based on high-fidelity coastal surge-wave model predictions for 300+ optimal storms in a coastal region, can be used to produce:
- Real-time forecast of maximum coastal inundation -> **aid evacuation planning**
- Design flooding scenarios -> **aid pre-season evacuation and resilience planning**
- 1% flood map -> **quick and frequent update of flood maps**  
<https://link.springer.com/article/10.1007/s11069-019-03807-w>
- Estimate flooding during design storms, e.g., 1% storm, 10% storm vs. 1% flood
- RFMS can be produced for the entire Atlantic and Gulf coasts
- High quality high frequency inundation data needed to verify model flood
